Uniblitz® CS25
25mm Uni-Stable Optical Shutter

Overview

The Uniblitz CS25 has been designed to provide accurate, repeatable exposures for a wide variety of applications including microscopy, video imaging, and more. The slim form-factor provides a 25mm aperture that can be inserted into a 2.37 inch diameter housing. The CS25 is available in a housed or an un-housed configuration for OEM applications (or simply where spatial limitations are a consideration).

Uni-stable shutter devices, like the CS25, require power to hold the blades in the open state.

Key Features

- 25mm aperture
- Uni-stable operation
- 510A cable included
- Slim, small form-factor
- RoHS Compliant
- Transfer time on opening: 9.0 milliseconds
- Total opening time: 12.0 milliseconds
- Configured for the VCM-D1 Shutter Driver

Product Options

CS25 ② ③ ④ ⑤ ⑥ - ⑦ - ⑧ Ex: CS25S3T0-EC-21

① Shutter Series:
- CS25

② Driver Compatibility:
- S: Use with VCM-D1 (Std.)
- E: Use with D880C or VED24

③ Housing:
- 1: Un-Housed
- 3: #3 Housing

④ Blade Coating:
- T: Low Energy (Teflon®)
- ZM: High Energy (AlMgF2)

⑤ Electronic Sync:
- 0: Omitted
- 1: Included

⑥ Connector:
- L: 18” flying leads (Un-housed only)
  • Leave blank for 5-pin Switchcraft connector

⑦ Encapsulated Coil:
- EC: Included
  • Leave blank if not required

⑧ Mount:
- (③ housing only)
- 21: Zeiss Axiovert
- 24: Olympus BX/IX
- 27: Nikon
- 105: C-Mount (Male)
- 106: C-Mount (Female)
  • Leave blank if not required

1 Other blade coating options may be available by special order.

2 Input side only; Teflon® coating is on opposite side to protect shutter blade surface. Light source must be input to the reflective side only.

1. Voltage level required across actuator coil when being held in the open position.
2. (Continuous/Burst) Continuous frequency rating specified at shutter’s minimum exposure pulse. Burst frequency rating specified for four (4) seconds maximum with one (1) minute minimum between bursts.

---

The electronic synchronization system provides a feedback signal (through the driver utilized) after the shutter transfers to the open state. The system incorporates an infrared emitting diode, an infrared sensitive detecting transistor, and an interrupting vane. The vane is attached to the shutter so as to block the light path between the emitter and detector in the closed position. When the shutter transfers to the 80% open position, the vane is removed from the infrared light path, allowing the emitter to switch the detector to the active state. For the CS25, this system uses a similar activation flag attached to the mechanism, which triggers a reflective emitter/detector device. **No connection to the designated synchronization pins when no electronic sync. is selected.**
